R&D Projects 2019/20

INVESTING IN RESEARCH TO SUPPORT THE ON-GOING IMPROVEMENT OF THE EGG INDUSTRY
Darling Downs Farms, Queensland

Project Background

The potential benefits of adding wood by-products to composting manure to create a valuable, nitrogen-rich product for horticultural industries was recently investigated by the Queensland University of Technology, in an Australian Eggs’ funded project.

Current manure composting techniques can result in significant loss of nitrogen and increased methane and ammonia waste emissions. While adding carbon-rich material such as sawdust is known to increase the nitrogen content of the composted manure, it comes at a higher operational cost.

Project Aim

Conducted on an Egg farm in the Darling Downs region of Queensland, the trial aimed to establish the ideal inclusion rate of wood by-products to composted manure to maximise nitrogen retention and economic performance.

Outcomes

Following a successful on-farm trial, egg farms can now use the determined inclusion rate formula to compost chicken manure more effectively and more profitably.

The researchers found nitrogen losses can be significantly reduced when more sawdust is added to achieve a carbon to nitrogen ratio of 21:1.

Conversely, suboptimal inclusion rates of sawdust resulted in nitrogen losses of more than 55%, representing an economic loss of approximately $25 per tonne of fresh manure or approximately $250,000 per annum for a facility that comports 10,000 tonnes a year.

Greenhouse gas emissions recorded in this trial confirmed that stockpiling and composting poultry manure generates relatively low GHG emissions, compared to other manures.

Factsheets

Australian Eggs has created a number of factsheets on this topic to help producers earn additional farm income from manure.

Scan this QR code to view the factsheets:
BIOSECURITY &
FLOCK HEALTH

Spotty Liver: Autogenous Vaccine
Developing an autogenous vaccine to help reduce the impact of spotty liver disease on production.

PLANNED COMPLETION – JANUARY 2020

Study of Microbiota of Laying Hens from Different Production Systems
Studying the development of gut microbiota in pullets from rearing until 80 weeks of age in both cage and rearing systems to better understand the role it plays and allow optimisation of diets that support gut health.

PLANNED COMPLETION – MAY 2020

Decontamination
Addressing knowledge gaps and developing a set of guidelines and procedures for every-day decontamination of production areas to manage the risk of disease infecting and spreading within the flock. Guidelines produced will be production system specific and include robust methods to validate efficiency of decontamination.

PLANNED COMPLETION – NOVEMBER 2021

SUSTAINABILITY

Sustainable Worm Control
Gaining an improved understanding of the prevalence and management of parasitic worms within free range egg production. The research findings will be used to create a WormBoss Chicken tool that helps producers to diagnose and manage worms.

PLANNED COMPLETION – APRIL 2021

Egg Producer Guide to Solar Energy
Creating a practical guide for producers to understand the process of installing and using solar and conducting a cost-benefit analysis to assess the return on investment and potential value to the business.

PLANNED COMPLETION – JUNE 2020

Nutrient Mass Balance On-Farm
Completing a comprehensive study that identifies all nutritional inputs and outputs across the life of a flock. Researchers are examining how nutrients are distributed around the farm, with a focus on quantifying manure deposition. Producers will subsequently have better tools for conducting environmental assessments and managing waste.

PLANNED COMPLETION – AUGUST 2020

Assessing the Carbon Footprint of the Egg Industry
Undertaking a life cycle and carbon footprint assessment of the egg industry to establish a benchmark. The research will provide carbon mitigation options and determine the cost of production and supply chain pathway for a carbon neutral egg. Results will enable cross industry comparison of carbon impact and provide insight into how to move toward a carbon neutral future.

PLANNED COMPLETION – NOVEMBER 2021
Values in Welfare 2.0
Following on from the recent values scoping project, this research will survey the community to gain a deeper understanding of how Australians trade off their values in relation to animal welfare and other areas of concern such as human health and the environment.

Practical Strategies to Measure Hen Welfare
Using the emerging field of micro RNA to identify potential biomarkers of affective states in hens. It will identify positive and negative markers that can be tested in pooled egg samples.

Resilient Plants for the Range
Trialling and identifying plant species that can be used on outer range areas to maintain ground cover and encourage chickens to range throughout all Australian climates. Guidelines will be developed that contain plant choices for ranges based on rainfall, soil and climatic factors and resilience to chicken foraging.

Impacts of UV Light
Investigating UV light and light intensity and its effects on ranging behaviour of free range hens. This will determine whether hens prefer or avoid high levels of UV or light intensity, how ranging behaviour is affected and will better inform shade requirements.

Causes of On-Farm Smothering
Conducting a comprehensive study of 80 flocks in Vic and Qld to identify factors that are associated with smothering events. The work will allow future testing of interventions to prevent or minimise smothering.

Efficacy of Autogenous Vaccine for SE
Testing the validity of using an autogenous vaccine to control Salmonella Enteritidis.

Probiotics for the Control of Salmonella
Determining probiotic efficacy in protecting against, or reducing, Salmonella shedding by birds. This will assist egg farmers in developing cost-effective Salmonella control programs.

ANIMAL WELFARE

FOOD SAFETY

PLANNED COMPLETION – MARCH 2020

PLANNED COMPLETION – APRIL 2020

PLANNED COMPLETION – MAY 2020

PLANNED COMPLETION – SEPTEMBER 2021

PLANNED COMPLETION – MAY 2020

PLANNED COMPLETION – MAY 2020

PLANNED COMPLETION – DECEMBER 2021
Feed Review
Reviewing the nutrition profiles of common feed ingredients used in the egg industry. This will assist egg farmers in evaluating current feed practices and formulating effective low-cost rations.

Pullet to Late Lay Nutrition
Gaining an understanding of how to optimise egg shell quality at peak lay through nutritional management from 18 weeks. Hens of lighter and average weight will be trial-fed on diets of either higher or lower nutritional density to 36 weeks, after which their feed efficiency and egg shell quality will be measured.

Industry Capacity Building
Training and professional development designed for promoting leadership and a high level of competency at all levels of farm staff within Australian egg businesses. This includes a new suite of husbandry training in addition to formal certifications offered through 4UpSkilling:
- EggStart
- Cert III in Poultry Production
- Diploma in Agriculture (Poultry).

Integrated Schools Education
The All About Eggs program continues to be expanded through refreshed resources for primary school students, continuation of the hatchery program and new interactive content for secondary schools. The program will foster a community of Australian school students who are educated and engaged on the value of eggs and egg farming.

Human Health – Vitamin D research
After 2018 nutritional research showed eggs can supply up to 82% of of human daily Vitamin D requirement, a new research project seeks to further investigate the role eggs play in preventing Vitamin D deficiency. People who are eating eggs five days a week will be assessed for Vitamin D at the end of winter, when levels of the vitamin are usually low, and then again 3 months later to see if eating eggs has a measurable effect. This information will be used to promote the value of eggs in a healthy diet to healthcare professionals.
