

A Comparative Study of the Nutritive Values of Triticale and Wheat for Laying Hens

Organisation: University of Adelaide

Publication: 1 October 1998

Researchers: R.J. Hughes

Categories: Feeding & Nutrition

Tags: diet, egg quality, flock quality, laying hens, laying performance, triticale, wheat

This study examines whether wheat can be substituted by triticale, a generally cheaper cereal grain, without prejudice to performance of the flock or egg quality.

This study examines whether wheat can be substituted by triticale, a generally cheaper cereal grain, without prejudice to performance of the flock or egg quality. The results show that while triticale is a useful alternative to wheat for inclusion in diets for laying hens, the particular sample of triticale used in the study was somewhat inferior in nutritive value compared to the wheat - judging by small losses in laying performance.
