

Eggs as a source of essential Docosahexaenoic Acid (DHA) - In the diets of weaning infants

Organisation: Flinders Medical Centre

Publication: 1 June 1998

Researchers: R.A. Gibson, M. Makrides & J.S. Hawkes

Categories: Human Health

Tags: nutrition, Docosahexaenoic Acid (DHA), egg yolk, infant diets

This project provided a unique, systematic study of the nutritional value of including egg yolk in the weaning diet of breast and formula fed infants in order to address current nutritional issues pertinent to all infants.

This project provided a unique, systematic study of the nutritional value of including egg yolk in the weaning diet of breast and formula fed infants in order to address current nutritional issues pertinent to all infants. The study was completed in 1998 and concluded that egg yolks are a safe and nutritious weaning food.
