

Elimination of "fishy" taint in eggs from hens fed diets containing canola meal

Organisation: Poultry Research and Development Centre, Department of Primary Industries Queensland

Publication: 1 June 2005

Researchers: R. Perez-Maldonado and T. Treloar

Categories: Feeding & Nutrition

Tags: diet, canola, canola meal, fishy taint, sinapine, diets

When fed canola meal, the presence of a compound called sinapine in the meal often causes hens to lay eggs with a fishy taint. This study aims to identify the exact levels of sinapine that cause this, and to eliminate the phenomenon.
