

Molecular epidemiology and pathogenesis of infectious laryngotracheitis viruses in Australia

Organisation: The University of Melbourne

Publication: 1 March 2006

Researchers: A.H. Noormohammadi and N. Kirkpatrick

Categories: Biosecurity & Flock Health

Tags: isolates, genetic, genomic, Infectious laryngotracheitis, marker, outbreak, tracheal lesions, virulence

The purpose of this study was to determine the virulence and spread of the Australian ILTV virus, in order to establish a genetic marker for the disease. This could then be developed as a tool for investigating the epidemiology of the disease.
