

The significance of wet droppings in laying hens

Organisation: University of New England

Publication: 1 June 1999

Researchers: M. Choct, J. Roberts and S. Walkden-Brown

Categories: Biosecurity & Flock Health

Tags: genetic, egg shell quality, excreta moisture, cereal grains, chloride, intestinal spirochaetes, magnesium, wet droppings

The project was initiated due to numerous complaints from the industry egg producers regarding the issue of wet droppings and the hygienic implications this causes. The focus of the project was to examine wet litter problems from a nutritional perspective and to develop strategies minimising the problem.
